

ThinnestAI Meeting — Question Checklist

Calevate vendor due diligence · August 2026 · **GET IT IN WRITING** = ask for email confirmation after the meeting

How to run the meeting: don't go top to bottom. Open with Category 2 (agency permission), then 3 (money) and 4 (capacity) — the deal-shapers. Categories 1 and 5 next. Technical ones (6–10) can partly move to email afterward — their written replies become your paper trail. End by mentioning you are evaluating one other platform in parallel (true: Bolna). It keeps every “in writing” request honest.

1 About the company — will you still exist next year?

- **“How many people work at ThinnestAI right now?”** **GET IT IN WRITING**
Why: A 2-person and a 15-person startup are very different risks. You are allowed to know who you are betting on.
- **“Are you funded by investors or running on your own money? How long can you survive at current income?”**
Why: No funding record exists anywhere publicly. If they have 6 months of money left, you need to know.
- **“How many paying customers do you have today?”**
Why: Their website shows zero customer names or testimonials. “You’d be one of the first” is not fatal — but it changes what you demand in return (better price, better promises).
- **“Can I talk to one or two of your existing customers as references?”**
Why: A healthy company arranges this happily. Dodging the question is itself an answer.
- **“Who exactly do I call when something breaks at 9 PM on a Sunday, and how fast do you actually respond?”**
Why: Your clients’ phones run 24/7. “Email us” is not acceptable for a dead business phone line.

2 My business model — am I even allowed to do this? (BIGGEST DEAL-BREAKER)

- **“I’m an agency. I’ll build and run voice agents for many different businesses — clinics, real-estate offices — all inside my one ThinnestAI account. They pay me, I pay you. Is this officially allowed? Please confirm by email.”** **GET IT IN WRITING**
Why: Their Terms of Service are completely silent on this. Silence means they can change their mind after your business is built on their account. The single most important question of the meeting.
- **“Do you have any plans for agency features — separate workspaces per client, or partner pricing?”**
Why: Tells you whether they see agencies as customers to support or competition to squeeze out.
- **“Will you ever sell directly to small businesses yourselves?”**
Why: If yes, they eventually compete with you using your own usage data. Watch the body language.

3 Money — what will I actually pay?

- **“Is ■1.5 per minute the full price, or are there extra costs I’ll find later — number charges, storage, recording, API fees, anything at all?”** **GET IT IN WRITING**
Why: Cheap headline price + hidden line items is a classic. Make them list everything.
- **“If you raise the price, how much notice do I get? Can we agree on 60 or 90 days in writing?”** **GET IT IN WRITING**
Why: They are cheaper than every competitor; cheap prices from young startups usually rise. Notice time = your time to migrate calmly instead of in panic.
- **“At what monthly volume do I get the ■1.25 rate? And can we talk partner pricing, since I’ll bring many businesses onto your platform?”**
Why: Their site mentions ■1.25/min at high volume. You are an agency bringing a pipeline — ask for something in return.

- **“If I use your own Vega and Aero voice models instead of my own Sarvam keys — is that really zero extra cost? What’s the catch?”**

Why: Someone pays for those servers. “Free” usually means the price is temporary or the quality is lower.

- **“Do I get a proper GST invoice I can claim input credit on?”**

Why: You will invoice your clients with GST; theirs must be clean too.

- **“How does billing work exactly — per second, or per minute rounded up? If a call fails after 2 seconds, am I charged?”**

Why: Rounding rules quietly change your real cost by 10–20%.

4 Capacity — how many calls can I actually make?

- **“How many calls can run at the same time on my account? What is the number today, and what does one extra line cost?”** [GET IT IN WRITING](#)

Why: Published nowhere. Your whole outbound-campaign planning depends on this number. (Competitors: Retell includes 20 lines, Vapi 10.)

- **“When I hit that limit, what happens to the next call — does it wait in a queue or just fail? What error do I see?”**

Why: Your system must know whether to retry or back off. “It queues” vs “it fails” are very different designs.

- **“Your docs say I can only START 5 outbound calls per minute. For a campaign calling 500 people that’s painfully slow. Can this be raised? To what? At what cost?”**

Why: Docs-verified and a real bottleneck for bulk campaigns. Get concrete numbers, not “we’ll see”.

- **“How fast can you raise my limits if I sign a big client next month — days or weeks?”**

Why: A client win shouldn’t stall a month waiting on vendor capacity.

5 When things break — what happens to my clients' phones?

- **“If your platform goes down mid-day, what does a caller to my client’s clinic hear — dead silence, busy tone, or does the call forward somewhere?”** [GET IT IN WRITING](#)

Why: The worst outcome in this business is a patient calling a clinic and hearing nothing. Confirm a fallback (forward to the clinic’s own phone) exists — and test it.

- **“Do you have a status page where I can see if you’re down? If not, when will you have one?”**

Why: Checked — they don’t have one today. Without it you learn about outages from angry clients.

- **“What was your worst outage so far — how long, and what caused it?”**

Why: Every honest engineering team answers this instantly and specifically. Vague answers are a red flag.

- **“Will you give me an uptime promise in writing — an SLA — with money back if you break it? Even a basic one on the enterprise tier?”** [GET IT IN WRITING](#)

Why: Right now they promise you nothing: no SLA, liability capped at 3 months of your fees. Even 99.5% with service credits shows they take reliability seriously. Their reaction matters as much as the answer.

6 Connecting to my system — will the plumbing work?

- **“When a call ends you notify my server. If my server is briefly down you retry only 3 times over a few minutes and give up. Can that be extended? Either way I’ll poll your call-list API regularly to catch anything missed — any problem with that?”**

Why: Missed notifications = missing leads in your client’s CRM. Make sure they won’t rate-limit your safety-net polling.

- **“Walk me through your webhook signatures once. And is there a dashboard where I can see every delivery you attempted, and replay a failed one?”**

Why: Docs say this exists; confirm live. It’s your forensic trail when a lead goes missing.

- **“Your doc pages show /v2/ in URLs but your OpenAPI file shows different paths. Which is the truth? Which one will not break?”**

Why: A real inconsistency in their docs. Small, but the answer shows how well they know their own product.

- **“Can I attach my own data to a call when I start it — like a lead’s name — and get it back when the call ends?”**

Why: Your system matches calls to leads this way. Docs suggest yes; confirm it round-trips.

- **“Recording download links expire in 1 hour. Any plan to extend that? Can I re-request a fresh link for an old call?”**

Why: Docs-verified 1-hour expiry. Your pipeline copies recordings immediately, but you want a recovery path if that job fails overnight.

- **“Can I do everything through the API without ever touching your dashboard — create agents, update prompts, buy numbers, attach knowledge bases, set my Sarvam keys?”**

Why: Your whole admin console automates their platform. Any dashboard-only step breaks your automation.

7 Voice quality — does it actually speak good Telugu?

- **“Can we do a live Telugu test call right now, in this meeting, or today?”**

Why: Nothing they SAY about quality matters compared to what you HEAR. Test names, phone numbers, and Telugu-English mixed sentences — exactly where cheap setups fail.

- **“I want to use my own Sarvam keys — Saaras V3 for understanding, Bulbul V3 for speaking. Fully supported? Any features that only work with your own models?”**

Why: Bring-your-own-keys is your quality control and your escape hatch. If their “free” models get feature-favored, your independence quietly erodes.

- **“How good is your own Aero voice at Telugu — honestly? Your changelog only shows Hindi voices.”**

Why: Their published voices are English/Hindi. If Telugu isn’t their priority, the “free models” pitch is irrelevant to you.

- **“What is the real voice-to-voice delay on an actual phone call — not a browser demo? Can I measure it on a real number this week?”**

Why: Target is ~1.1 seconds. Browser demos always feel faster than real phone calls. Insist on a real PSTN call.

8 Phone numbers & calling rules — keep me legal

- **“Do you support Vobiz and Exotel numbers? Can I buy and assign numbers fully through your API?”**

Why: Your planned telephony partners. Confirm both, via API, not dashboard.

- **“For promotional campaigns I need 140-series numbers, and for service calls 160-series, with DLT registration. Do you help with any of that, or is it fully on me?”**

Why: The legal side of outbound calling in India. “We have a guide” vs “never heard of it” tells you their India seriousness. (Competitor Bolna publishes a full runbook.)

- **“Do you do anything automatically about DND numbers and allowed calling hours, or must my system enforce all of it?”**

Why: You’ll enforce it yourself regardless — but you must know if they ALSO block things, so the two systems don’t fight.

- **“When a call starts, can the agent’s very first sentence be guaranteed — my AI disclosure line? Can anything on your side delay or skip it?”**

Why: Legally required first utterance on every call. Confirm nothing on their side (hold music, delays) can swallow it.

9 My data — where is it, and can I take it and leave?

- **“Where is my call data physically stored? Does anything leave India?” [GET IT IN WRITING](#)**

Why: They say GCP Mumbai — confirm recordings, transcripts AND backups all stay in India. Matters for DPDP law and your client contracts.

- **“If a caller demands deletion, can I delete their recordings and transcripts from your side via API — and get proof of deletion?” [GET IT IN WRITING](#)**

Why: Indian data law gives callers the right to erasure. It must work on their side too, with evidence.

- **“How long do you keep recordings and transcripts on your side? Can I control that per agent?”**
Why: Their retention must not undercut your promises to clients (90-day minimum for recordings).
- **“If you shut down, or I leave — can I export every agent’s configuration, all recordings, all transcripts through the API? Will you commit to a 30-day export window in writing?”** **GET IT IN WRITING**
Why: The escape hatch. A young vendor without this is a trap. Also subtly tells them you have alternatives.
- **“Who at your company can see my clients’ call recordings and transcripts? Any access controls or logs on your side?”**
Why: Their staff can presumably see everything — including patients’ medical calls. Ask what protections exist.

10 Product features — what do I get without building it?

- **“Your campaign system — retries, schedules, DND re-checks — can I drive all of it via API? What does the campaign-estimate feature tell me before launch?”**
Why: The plan is to configure their built-ins rather than rebuild them. Confirm they’re API-drivable, not dashboard-only.
- **“Do you support draft and published versions of an agent, so I can test changes before they go live? And instant rollback?”**
Why: Your quality process depends on staging → live promotion. Docs say it exists; confirm how it behaves.
- **“Call transfers to a human — how do they work, and what happens if the human doesn’t pick up?”**
Why: “Transfer to reception during business hours” is a core clinic feature. The failure case matters as much as the success case.
- **“WhatsApp or SMS follow-up after calls — what exactly do you support?”**
Why: A nice-to-have that saves building it in month one.
- **“What’s on your roadmap for the next 6 months? Is anything I rely on today planned to change — pricing model, bring-your-own-keys support, anything?”**
Why: Their in-house models (Vega/Aero) could change the whole “bring your own models” story. Hear the direction now.
